Infidelity Economical Tasking Management

Management of tasks according to real world actions.

by Laurence Green

Thought is a process of being compounded into a state of equal retardation to environmental entities forcing their mimicry of thought into action as calls of rally to have distraction from personal forward.

Tasks are equal to understanding how a process it meant to go ass a plan of action in thought, by expressions of environmental needs as system of tasks is always going to be compounded by other tasks flowing into attention. Assertions of arrogant neglect from tasks to claim 'not of my order' or 'lower class' action than expected to be completed is a retardation of personal desire into available options for tasking a team into action. Conceptual orders are not a justifiable method to class out actions of cleaning a toilet after you use it.

Social Love as emotional devil external of earth is defined in universe by native physical drug growth and distribution in formal acceptability as cannabis. Technically retarded to introduce into a system cannabis is a filth not expectant to be included into a tasking management system as pink shaded glasses will never allow perfect sight of long distance tasks requiring long term activities to complete resulting in lethargy and ignorant churn of staff.

Mathematical artistry must complete a horoscope of emotionally dependant tasking ordering value of enrichment by calories, proteins, sugars, salts, and additives expected from eating a task.

Task Consumption

Departments eating and passing waste out of their system into a financial fusion tank increases of working interaction form documented effort is capable of creating substances of emotional management. Being a company need to remove sofa's or wasting people watching others act at all times is removal of cannabis and its irrational attitude in attempting to sun bath by looking at people. Orders of emotional need is derived from personal sexuality of a company, food is required to sustain energy enough to project a sexuality internally and publicly, work is required from all team members or have process with a task to break.

Men need on average 2,000 calories per day while women are 1,500 with differences on affluence in weight management expected for a whole department. Defining a measurable value in needs to sustain an Atmosphere of character to each task like native labelling of Gentleman, Strongman, Emo, or Alien a minimum calorie count can be maintained throughout external activities to a meeting rendering purchases of tasks equivalent to shelf and fridge life depending on preservation method applicable for a task.

Electricity Outlet

Counter to eating is performance of output as sexuality and reality of being female and male bodied. As such output of calories don't equate to a value potential of sex and social interaction leaving need for sex based weight system to evaluate social occasions as emotionally rich energy. Electricity is a healthy term for use within realm of work and offices allowing satisfactory intercourse to supply each other with electricity in values of joules, amplitudes, and frequencies.

Power supply to any electrical device must be rated as a hertz or frequency according to source power generating electricity, departments with population differences have different internal and external frequencies giving break points in acceptable meeting formats and requirements as electrical components such as transformers.

Being base energy source of modern humanity to deliver tasks from one person to another electricity is easily calculable in terms of processing to torque of an engine. Harmonising frequencies across teams as sections interacting transfer of energy through tasks is valued by rating of number of people required to engage a situation, external from a task as social meeting. Creation of debt receipts (a formal receipt of action before currency is created) can be appended to a task as official meeting and confirmation to conduct a task as part of debt to credit journey through effort, by understanding a total group or inter

department requirements electricity can be evaluated as networking power between a companies parts from start to finish of a task.

Power Conversion

Calories	Electricity
2,000	6Hz (people) at 8,368,000J

* Introducing people part way through a task on a single issue is a position of having a fluctuation, thus a mention in a ticket is a '±' increment.

Aggression, a negative impact on a working environment equaling to a negative charge in a system.

Vibrance, a positive attitude trait determined by an emotionally rich person engaged into a meeting.

Equating a positive and negative as a single mark of attendance to people in a meeting defines appropriate social torque within a department.

Positive charges produce while negative charges reduce.

Power Economics

Electricity documented into a task defines the effort from perspectives of a group towards broadcasting a sexuality via radio. Equating all broadcasts from a department to standards of positive or negatively charged currency states of total corporate desire to be of sex and sexuality can be maintained as KPI of being a higher conceptual order worthy of creating a currency of themselves resonating in class of own documentation and effort.

Group dynamics as companies desire to form strong bonds with each other to point of Love and Friendship while understanding Hate between and surrounding them delivers congealed behaviour to material of self: gas, water, custard, wood, metal, and glass relationships. As process of formalising real material worth of self as a business a currency from a well defined entity of relationally equivalent racial conditions in needs and actions renders sexuality of itself as self imaging to pornography of acceptable personal projections: coolness of an x-ray.

Excess calories not used during a scrum must be preserved for another meal time or be wasted and created again once more food is available for a team to created food for themselves. Each persons efforts placed against a task must be equivalent to a task being eaten by a single person, thus management of meals to remain under 700 to 1,200 calories defines a meal for a department to tackle. Three meals a day is not normal and expected to fluctuate depending on lifestyle of a department, remaining thin and athletic is most efficient through provision of exercise and action of self into tasks requiring thought to complete thus electricity is important driving force as sexuality defines a persons attitude too desire themselves in mirror reflections and from other department perceptions.

Meetings must be held in the morning to collect a departments thoughts on what to do for the day, planning meals and what types of people are required while others can relax and heal themselves in personal productions. Four days is basic definition for a department or teams travel through night and day working hours while time away from office or a fifth day is considered sleep and dreaming for a department allowing active able bodies to supply themselves to tasks of desire of need for expressions in tasks to **expand conceptual order**.

Meetings

For a department with many people available as a family acting in polygamy sectioning of food and supply enough for four people to act as one defines a single cause for multiple teams to act in different stages for different tasks, balancing a work and food process in creation and destruction from self without reliance on external teams. For a department to walk itself through its environment (days of a week and month) aspects of teams focusing on arrangements of strengths according to traits of fertility and farm creates a musical rhythm of itself by dance.

Training meetings

First Position Meeting - Introductions.

Second Position Meeting - Personal traits selections.

Third Position Meeting - Produce tasks to group.

Fourth Position Meeting - Allocation of tasks within group.

Fifth Position Meeting - Produce tasks to department.

Expression Meetings

Turnout Meeting - Tasking a team to practise common actions of flexibility in skills and traits expanding ability of a department from internal presences.

Developpe Meeting - Strength and flexibility for a team is developed into practised tasks and actions of a home environment.

Jete Meeting - A checkup meeting to evaluate a position of tasks with ability to land on another task.

Fouetté Meeting - Tasking an entire department according to types of traits required defining a horoscope lead to handle successful Fouetté.

Plié Meeting - Cherry picking and cleaning session of tasks in fridge and cupboards checking use by dates for tasks according to their packaging.

Meeting Regularity

Regularity is not a determined fact of time as all time is irrelevant on a global scale only the seasons of harvest to create food and electricity with others is important.

Horoscope of meetings is brought into preference of needs to a department, with young teems regular sets of training sessions are expected to come accustomed to presenting themselves within a group while older teams used to interacting in front of external departments can extend themselves to only hold department Fouetté Meetings. Portions of a whole department can then satisfy their own needs by performing flexibility meetings on their own and rely on performance meetings with a larger internal group.

Flexibility Meetings: Turnout Meeting and Developpe Meeting.

Performance Meetings: Jete Meeting and Fouetté Meeting

Plié Meeting is an individual and group activity always required in all concerns for a healthy environment: empty ash trays, clean kitchens, select missing gadgets, throw out rubbish.

Statement and phrase of "I've got no time for this" is wrong, there is always time for someone to go do something meaning that time is irrelevant for their own boredom at a task. Concern for time is interactions between tasks "when is this complete?" "When is your ting complete?" All tasks are reliant on each other determining a total fact of horoscopes being single factor managing when things are available as an option to act on and when things are presented as an availability.

Departmental ignore definitions are required as a needed aspect to include into an environment: tasks passed into a department must be checked to be ignored and not replied to or have increased / continued communications with another department, departmental ignorances are a fact of people working in an office tasks can come through but only acted upon when introduced, once complete the tasks approaching can be unignored and sifted accordingly.

Death of a task is its break from department handled after a Plié Meeting, by selection a Hearse for acting on outcome from a Plié Meeting their actions are recorded as publications, cleaning of projects, and other chores before as a task and after each motion to bury the dead. A Hearse is given full grave duty between Plié Meetings meaning if something wrong happens as a result it is their duty to rectify the situation while maintaining standards of never pulling anything out of a bin or trash can (never dig up the dead).

Grave Duty

Grave Duty demands a respectful management of grounds passing filth of quality into appropriate selections of wasting. Having people visit a grave yard is respectable for a team providing products no longer worth of function in modern life, health of a graveyard is determined by upkeep and reliability to always be available for others to interact with a minimal identity of who a product was. Graffiti and littering is not allowed and comes with penalty according to currencies expected to be transferred to them allocated by corporate legal management.

Grave Duty comes with religious aspect for a company to maintain observation over a graveyard and its property ownership, requests out of hours for a company can be issued to a person on Grave Duty acting in an Up and Down position. Creation of tasks from a Hearse is trafficking of corpses from a location to location, allowing dead food as material to be collected into a fridge or cupboard marked with immediacy of consumption: fresh ham needs eating in 3 days while cheese can be stored for over a week.

Surgeons

Emergency call outs in event of water leaks or boilers breaking is a concern for a Hearse to escalate if contacted regarding a matter. A corporation should appoint a court member to ascertain death and severity of a situation for any out of hours actions required allowing for rotation and holiday from situations proving fatal to flooding or freezing a family out of their home with a company. Emergency people are called Surgeons, presiding over communications flagged as emergency a Surgeon can take immediate action against a corpse to revive effective function.

Hexachain Economy

Connectivity Developers are a needed representation to complete conversion of a task from material object into a state of worth exchange.

Production of music to create currency as a product to form currency from a tasks efforts and its involvement internally to a company defines information encoded through encryption action of one way systems to define the currency as encrypted and read once. By creating beauty from soil a segregation in relationship to economical impact for a company building their interactions with others renders states of currency value according to effort and quality of work compared to function of economy formed to interact with each other.

Economies:

• Learning material is a machine automatically turning off mechanic. Soil.

• Language expression to deal in culture is a machine of competition. Plants.

• Musical expressions of audible interest is social integration. Animals.

• Visual artistic expression is conveyer belt of interactions with response challenges. Human.

• Mathematical expressions as economical function to create currency. Alien.

• Military expression is management of others through legal conditions of life. Solar.

Dividing economies as above ability to understand were to locate appropriate fertile land and create wealth from an economy is a progressive and elementary act of agriculture teachings starting from creating options and varieties of soil to planting a seed in soil. Water is required as feeding interaction between soil and plants extending need to have creation ability in defining a religious ritual of generation to complete actions in self made water through observations and advertisement of currencies providing themselves as output from particular companies.

Not knowing inherently what a currency value contains with the automatic destruction of a currency object in digital terms removes ability from all people using currencies to trust a standard equivalent from observations is maintained as outputs and declarations from organisations.

Valuations:

Content relations are defined by task, description of a task is the effort behind a currency value. All effort being actively discerned by interpretation of IET Management processes of thought to have a currency created is by slim investigation as bisection of currency output a debt management to ensure evaluation in standards are up held. Itself as an effort to task currency to support a management system within plant and animal blood systems can support functions of thought to create machines powering higher constructs of job opportunity.

Creation

By using [VesperCrypt](#) or a version of application similar to chunk up sections of encryption, ability to distribute £10,000 of chargeable work to product value of £14,000 into chunks as distributable currencies. Retaining 10% of all currency created as a baseline from encryption chunking ability to **assure** by personal possession of un-decryptable content being available out in wild as currency is assured of validity.

To recreate all content from a company, personal retention of master files encrypted removes ability from public to failure in understanding the whole batch of data.

Assurance of valid content is exchanged as retainers for batches upon creation, inter company validation is given primary due diligence during construction of relationships. Investment into a company or individual acting to tackle failure in world, society, and themselves is a complete potential to rebrand currencies into a larger corporation as Snowballs gravitating towards an investor's well.

Removing need for insurance from trust relationships built during growth period can supply a world driven towards higher goals instead of relying on abusive insurance payments to be made to validate investment of an individual into a society.

Competitors

With Bitcoin and Blockchain technologies there is no assurance of value from a single currency, all data contained within coins can be copied and pasted with a different filename and meta data without any easily un-function bunging to reveal true content. By setting up fake websites to account for a fake ownership of a coin in not so much abundance or easily treatable valuation between people there is no value in collections of blockchain data sets, a world can be faked into thinking a computer is performing tasks to create relatively easily obtainable currency. Were is the validation of personal ability to match another persons output of energy?

By looking at a regular metal coin two people can come to their own conclusions on what value the coin holds for themselves, by setting two people the same task different approaches are taken with each while the outcome is normally similar, both documentable and individual. Encryption from these states and passed to each other decryption of the other persons data via a password validates through reading of another person's task as validation of valuation for matching outputs of energy.

Purchase at a shop is always a product for a single price as prices of a currency don't fluctuate in extremes while the product doesn't fluctuate to extremes either, by creating currency from a task purchase of a product can be validated in acceptance of same percent of an item depending on value of a task performed.

Coupons for vouchers are only valid at specific shops forcing control over a currency being valid to equal freedom of choice, by supplying freedom to have ability in tasking self to create currency freedom flows with Hexachain currencies.

Social Machine Economics

Hexachain economies provide a huge variety to a social engagement modelling system beyond the child toys of likes and dislikes of content on blogs and platforms, by modelling an economy of emotional characterised interactions through chain effects of same content a single retain from social programming can deliver an economical working effort from a single state of re-testable conditions as input. Supplying targeted audiences with social interactions tasks from a collective of people can centralise their actions as a collective tasking system as characterised IET South personalities capable of providing an external worker of social machinery.

Modelling reactions is one thing but providing real interactions internal to a department understanding relationships between online accounts as single or mixed commentary provides jobs worthy of expanding from failure in collective knowledge and corporate understanding of social structures. Connectivity Developers are the source of this form of information for an applications interpretation into social feeds surrounding a company and their competitors reactions going forward, irrational child reactions can be mitigated by providing emotionally targeted social awareness of corporate situations leaving contexts like environmental welfare and mob language incapable of articulating rational need for a company to perform and produce products needed by them themselves.

Social logic is available to be harnessed into a money making machine, constructing a programme capable to handle all characters for targeted portions of society a larger group can create parts to expand on social mechanics until petrol engines are viable as external human concept of social engineering. Spirit flowing through a companies engine removes itself from 'make money' to a real and viable solution of being a creature and predator in the wild engineering its environment with

targets to remove failure from others as much as from self creating more food and to have larger pools and farms to daw upon as a massive self growing programming effort of itself, by-product is money.
